*We consider the efficiency of the organic mode of production of agricultural products and the possibility of a science-based application in Ukraine. The analysis of the problems that may be faced by agricultural producers during the transition on organic production.*

***Organic production, transition period, organic certification, quality and safety of agricultural products.***

There are a number of problems facing any agricultural production in the transition to organic way ahrovyrobnyts-ment, and which necessarily must pay attention to the certification process. An analysis of international regulations, the transition to organic production system can occur both in the general economy, and cover only part of it. Hence the first problem, namely the spatial differentiation of fields of different ways of agricultural production and / or housing for farm animals, as well as visual differentiation - growing different varieties or types of crops or breeding different species or breeds of farm animals and to prevent mixing of organic and traditional products.

In view of the situation in Ukraine with implementation plans organic production vyokremylysya two main problems: the lack of legal framework for the organization, operation and control of organic production and certification of organizations and regulatory bodies; reduced profitability of agricultural production, especially during the transition period. Therefore, during the transition to organic production, we recommend that the specific placement of agricultural enterprises, the level of logistics and cost-effectiveness transition.
